              small_rotten_train = pd.concat([zero[:200],one[:200],two[:200],three[:200]
In [12]:
          Exercise-3
```

1.open the file. "small\_rotten\_train.csv"

```
In [13]: ▶ small_rotten_train.to_csv("small_rotten_train.csv")
```

### 2. The reivew text are stored in "Phrase"

```
In [14]: ► X = small_rotten_train.Phrase
```

### 3. The "Sentiment" columns is your target, say "y"

### 4. Pre-processing

### 5. Apply the above function to X

```
In [25]:
          f =[]
            import nltk
In [26]:
            nltk.download('omw-1.4')
             [nltk data] Downloading package omw-1.4 to
                            C:\Users\arulk\AppData\Roaming\nltk data...
             [nltk data]
            [nltk_data]
                          Package omw-1.4 is already up-to-date!
   Out[26]: True
In [27]:
          | for i in t:
                f.append(clean_review(i))
            n = pd.Series(f)
```

### 6. Split X and Y for Trainig and testing (Use 20% for testing)

# 7.Create tfidfVectorizer as below and perform vectorization on X\_train using fit perform() method

Out[29]: TfidfVectorizer(min\_df=3, ngram\_range=(1, 2), use\_idf=1)

# 8. Create MultinomialNB model and perform training using X\_train\_lemmatizered and y\_train.

Out[33]: MultinomialNB()

### 9. Validation on X test lemmatized and predict output

### 10.Classification\_report and Accuracy\_score

```
In [35]: ▶ from sklearn.metrics import accuracy_score,classification_report
```

```
In [36]:  acc = accuracy_score(y_test,y_pred_NB)
print("Accuracy score :",acc)
```

Accuracy score : 0.67

In [37]:	M	<pre>print("Classification Report :\n",classification_report(y_test,y_pred_NB))</pre>						
		Classification	Report : precision	recall	f1-score	support		
		0	0.71	0.76	0.74	33		
		1	0.70	0.67	0.68	48		
		2	0.62	0.57	0.59	37		
		3	0.60	0.66	0.62	38		
		4	0.72	0.70	0.71	44		
		accuracy			0.67	200		
		macro avg	0.67	0.67	0.67	200		
		weighted avg	0.67	0.67	0.67	200		

### **Exercise-4**

### 1.open "rotten\_tomato\_test.tsv" file into Dataframe

```
df1 = pd.read_csv("test.tsv",sep='\t')
In [38]:
                df1.head()
In [39]:
    Out[39]:
                     Phraseld
                               Sentenceld
                                                                              Phrase
                 0

                  1
                      156062
                                     8545
                                            An intermittently pleasing but mostly routine ...
                 2
                      156063
                                     8545
                                                                                  An
                  3
                      156064
                                            intermittently pleasing but mostly routine effort
                                     8545
                      156065
                                     8545
                                                 intermittently pleasing but mostly routine
In [40]:
             M X2 = df1["Phrase"]
            2. Clean this test data, using the function clean_review(), as before
```

```
In [41]: ► X2 = X2.apply(lambda X2: clean_review(X2))
```

### 3. build TFIDF values using transform() method

```
In [42]: ► X2_test = cv.transform(X2)
```

### 4. Perform using predict() method
